

WORKSHOP

› “Evolution of Meaning – A Workshop on the Evolutionary Biology of Communication“

→ Thursday, 11 June 2015

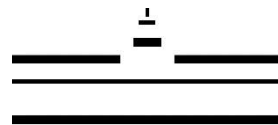

Biologists make free use of notions pertaining to meaning, such as when it is claimed that bright coloration on a poisonous tree frog means that it is noxious. Recent work in theoretical biology has shed light on these phenomena with the tools of Evolutionary Game Theory.

This workshop will explore meaning, as well as related notions such as cues, signals, handicaps, and crypsis, with an aim of understanding the evolution of communication in some of its rich variety.

With Prof. Dr. Mitchell Green - *Fellow of the Evolution Think Tank*
Philosophy of Language, Philosophy of Mind, and Aesthetics
University of Connecticut, USA
