## Gender & Science Studies: Investigating Social Patterns of Doing Physics

An explanation why women are underrepresented in all fields of physics, requires a multi-faceted approach. In analyzing how gender differences are produced and maintained we need to make connections between findings about distinctive scientific social and organizational practices, the historical formation of scientific institutions and the shaping of collectively shared epistemological premises. It is only a complex and comprehensive picture that allows to identify venues for a culture change and envisioning a better understanding what physics is, how it works and what it could/should be.
